FRAZION SERIES From Lucifer Lighting

FraXion from Lucifer Lighting is an exceptionally designed series of downlights that provides sleek design with quality engineering. The 4" nominal series, which is available in both square and round aperture, combines industry-leading engineering with precise control and user ease-of-use to provide a family of products that will work in a wide range of applications.

The series offers user-friendly and adaptable lighting control through a proprietary sliding pivot point that optimized the center point of the beam for 40° adjustability without beam clipping and room-side angle adjustment readings for repeatable angling. The fixture offers 361° rotation for precise adjustments in-field, and field-changeable optics to allow for revisions without replacing the housing and engine.

The series is available in three trim styles; Standard trim, microflange, and trimless. The standard and microflange trims provide additional ease of installation through the FraXion's internal hardware, allowing for more goof coverage, even in the microflange. The trims come in six standard colors with custom finish options available.

The series features an unprecedented 2.1" h IC / NIC housing in the FraXion shallow options and 6.7" h in the FraXion tall IC options, allowing for installation into IC locations previously unavailable in other fixtures.
